Tuned for Zodiac Application Compliance Test Program

Overview

“Tuned for Zodiac” is a low-cost, basic compliance testing program designed for developers who have optimized their application for Zodiac.

The “Tuned for Zodiac” logo is required for applications to be sold in the Tapwave online store.

The program includes a “Tuned for Zodiac” standard test suite and “Feature Icons” test suite. The feature icons graphically represent the major Tapwave enhancements that an application has implemented. These icons are designed to accompany the “Tuned for Zodiac” logo.

The “Tuned for Zodiac” logo and “Feature Icons” give customers assurance that applications displaying these marks have successfully been tested for usability, functionality and reliability. Tapwave customers are assured that the products are compliant with the Tapwave platform and incorporate new functionality featured in the Tapwave device.

The program brings awareness and recognition to your product. You differentiate your application by earning the distinctive logo and icons. The logo is designed to be used on product packaging, advertising, collateral and other marketing materials. The logo and icons signal to customers that:

- Your product is compliant with the Tapwave platform
- Your product makes full use of Tapwave’s advanced features
- Your product incorporates key new features of the Tapwave device, as applicable

The requirements for these logos are detailed in the Tuned for Zodiac Standard Test Suite, Section 2.

You can earn any combination of icons for features that you implemented in your application – support for full screen is the only requirement. You may chose to implement any of the other features, as appropriate.

The icons represent:

- Full screen
- Bluetooth
- Multi-player (via Bluetooth)
- Analog Controller
- Tournament Ready
- Vibration

Software applications are tested by Connect Global Solutions, an independent testing company.

The program features:

- Pricing: USD $400 (includes 'Tuned for Zodiac" test suite and Icon test suite). Fee covers one test pass of an application.
- Retest: USD $250
- Testing Company: Connect Global Solutions
- Test Guidelines: Published at http://www.connectcgs.com/tapwave Submission Process: Published at http://www.connectcgs.com/tapwave
- Promotional Opportunities: Your "Tuned for Zodiac" application is eligible to be made available for sale in the Tapwave online store

The requirements for these logos are detailed in the Tuned for Zodiac Icon Test Suite, Section 3.

1.1 What's the Process for Submitting My Application for Testing?

Contact Connect Global Solutions at http://www.connectcgs.com/tapwave for complete details.

1.2 What the Tuned for Zodiac test is NOT:

The Tuned for Zodiac logo does not provide a quality assurance guarantee. The compliance test does not:

- Test for the quality of the product
- Ensure that the product is "bug-free"
- Fully test all levels of the application, e.g., all game levels
- Review and test documentation
- Run extensive usability tests
- Perform gameplay testing

The Tuned for Zodiac program is not a certification test. The logo does not represent that Tapwave or the testing organization warrants the developer's product in any way. The developer may not explicitly state or imply that Tapwave or the testing organization in any way endorses the product.

2. Tuned for ZODIAC Standard Test Suite

Compliance

Provides assurance of compliance with the Tapwave platform

- Product adheres to Tapwave's published Best Practices document. This document can be found in the latest SDK.
- Application should respect preferences. Preferences should be respected in the following sequence:
    - User
    - System
    - Application
- Verify that application allows system messages, such as alarms, low-battery warnings, and system messages.
- Product plays nicely with the Tapwave device
    - e.g., application does not override the behavior of the "Home", "Power" or "Bluetooth" buttons
    - Verify that App functions when memory is low or displays proper error message displayed.
    - Verify that App functions when battery is low or displays proper error message displayed.
- If Windows is supported, an uninstall program exists and the product can be uninstalled. If Macintosh platform is supported, that the product can be uninstalled.

Functionality

This is a list of general tests that will be carried out on applications on the relevant devices.

- Install and uninstall testing (prc can be deleted and no data is left over)
- Basic functionality of application in accordance with functional docs
- Analog Controller
- Triggers
- Action Buttons
- 480X320 resolution
- Screen rotation
- Landscape support
- Dual SD slots
- Data Entry testing
- HotSync tests
- Color compatibility testing

- Bluetooth, (802.11b or GPRS/GSM if appropriate)
- IrDA and Beam testing if appropriate

Reliability

The product does not generate system crashes or frequent faults.

- Applications should either run or fail gracefully, as detailed below.
- Graceful Failure Standard:
    - If an application fails, it should not crash the user's device or require a reset.
    - An alert should be displayed to notify the user that there is an error.
    - The message should inform the user that the application will be exiting and what will happen to the user's data (i.e. data needs to be entered again or user input has been saved).
    - The message should tell the user what to do next (e.g. “Please re-start this application”, “If error occurs again, please contact technical support at 1-800-555-HELP”, etc.).

3. Tuned for ZODIAC Icon Test Suite

Full Screen is required. You may chose to implement any of the other features as appropriate for your application.

Full Screen

Application launches to full screen and runs full screen. The application fully supports full-screen landscape mode (480x320) when appropriate. The application may display the status bar during game play if desired.

- In Full Screen mode the application should not suffer any performance degradation as a result of full-screen mode.
- The application's various forms should all display properly, bitmaps and fonts should be readable.
- Fields should handle text entry in full screen mode. If the application saves and restores text in a field, or sets text to a default value upon entry it should do so without distortion.
- If status bar displayed:
    - All supported buttons function
    - Grey out the hide/show rotation if those modes not supported.

Bluetooth

The application must effectively transmit application data via Bluetooth. If the application supports the sending and receiving of data through Bluetooth, low level IR or serial communication, then error handling, response time and quantity of players supported will be tested.

Multiplayer

The application must support multiplayer mode through Bluetooth for a minimum of 2 users up to 8 users.

Analog Controller

The application must fully support use of the analog controller in an appropriate application function. For example, in a driving game, the analog controller would most logically map to the steering function. The application should offer the user the ability to fully customize controls or select between preset control templates.

- Browse through the application's various forms, alerts, and dialogs using menu, screen, and analog controller.
    - lists and pop-up lists
    - buttons and repeating buttons
    - checkbox

- tables
- menus
- sliders
- gadgets
- scrollbars
- popup triggers
- selector triggers

Tournament Ready

The application must support the High Score APIs and include a device database. A Tournament enabled application allows the application to save scores as a special score type. Applications enabled for tournament mode must include a simple dialog for entering a tournament code. (This code and user interface is provided by Tapwave.)

- If the application saves and restores text in a field, or sets text to a default value upon entry it should do so without distortion and following Tapwave look and feel.

Vibration

The application supports vibration effects, when appropriate. Vibration effects must be included in a logical use of user feedback mechanism. The requirement for earning the logo is that:

- Vibration effects are not overused to the point where the user experiences a constant vibration effect for his interaction with the application
- Provides logical and appropriate user feedback when a level of game play is achieved
